The prior art of records fails singularly or in combination to teach or suggest the followings:

A system comprising a first station configured to transmit and receive data modulated using a first modulation scheme; a second station configured to transmit and receive capable of transmitting and receiving data modulated using a second modulation scheme; an access point for communicating with the first and the second stations; and wherein, the access point transmits a beacon frame indicating a beginning of a first period during which the first station is not allowed to contend for medium access, the first period being followed by a contention period during which the first station is allowed to contend for medium access, the beacon frame also indicating a location of a contention sub-period within the first period during which the second station is enabled to transmit data modulated according to the second modulation scheme following a distributed coordination function access mechanism, as indicated in independent claim 1.

An access point for communicating over a local area network with a first station configured to transmit and receive and receiving data modulated according to a first modulation scheme and with a second station configured to transmit and receive data modulated according to a second modulation scheme, wherein the access point transmits a beacon frame indicating a beginning of a first period during which the first

station is not allowed to contend for medium access, the first period being followed by a contention period during which the first station is allowed to contend for medium access, the beacon frame also indicating a location of a contention sub-period within the first period during which the second station is enabled to transmit data modulated according to the second modulation scheme following a distributed coordination function access mechanism, as indicated in independent claim 12.

A first station in a local area network, the first station being configured to transmit and receive -data using a first modulation scheme, the local area network further comprising a second station configured to transmit and receive data using a second modulation scheme and an access point for communicating with both stations, wherein the first station receives a beacon frame transmitted by the access point indicating a beginning of a first period during which the first station is not allowed to contend for medium access, the first period followed by a contention period during which the first station is allowed to contend for medium access, the beacon frame also indicating a location of a contention sub-period within the first period during which the second station is enabled to transmit data according to the second modulation scheme and following a distributed coordination function access mechanism, as indicated in independent claim 20.
